

HR Analytics Dashboard — Training, Performance & Motivation

Domain: Human Resources Analytics | Tools: Power BI | Data: Employee-level training, performance, and satisfaction records across 6 departments

Summary

Objective

Build an interactive HR dashboard to test whether employee training investment actually translates into better performance, and to identify which departments and employee segments need the most attention on satisfaction and motivation.

Concepts / Methods Used

Power BI: DAX measures (averages, percentages), interactive slicers (Gender, Department, Salary Band), binned bar chart analysis, scatter plot with trend line, donut charts for categorical share.

Key Output

- Company-wide averages: Job Satisfaction 3.78/5, Performance Score 3.70/5, Total Training Hours 725
- Clear positive relationship between training hours and performance: employees with 0 training hours average a 2.00 performance score, rising steadily to 5.00 at 25+ hours
- Marketing has the highest job satisfaction (4.75/5); Sales has the lowest (3.00/5)
- Motivation is concentrated in Mid and Senior salary bands (40% each) versus only 20% in Junior band
- Motivation is fairly evenly spread across departments (16–18% each) — no single department dominates motivation share

Business Actionables

- Training investment is justified — the dashboard shows a near-linear payoff between training hours and performance, supporting continued or increased training budget
- Investigate Sales team satisfaction specifically (3.00/5, lowest of all departments) — likely candidate for a targeted engagement or workload review
- Design retention and motivation initiatives specifically for Junior-band employees, since they show the lowest motivation share (20%) despite likely being the largest future talent pipeline
- Use the interactive filters (Gender, Department, Salary Band) to drill into any of the above findings for a specific manager or HRBP conversation, rather than only acting on company-wide averages

Detailed Analysis — Actual Power BI Dashboard, Explained, With Actionables

Full Dashboard View

Actual Power BI dashboard: HR Analytics — Training, Performance, Satisfaction, and Motivation

What this is: A single interactive Power BI dashboard combining six visuals: three KPI cards (Avg Job Satisfaction, Avg Performance, Total Training Hours), a binned bar chart of training's impact on performance, a scatter plot of training vs performance by department, a bar chart of satisfaction by department, and two donut charts showing motivation by salary band and by department — all filterable by Gender, Department, and Salary Band slicers.

Layman meaning: This is designed as a working management tool, not just a static report — an HR manager can click 'Sales' in the Department filter and instantly see how every metric on the page changes for that team alone, rather than needing a separate report per department.

Actionable for the user: In an interview, be ready to walk through how a specific filter combination (e.g. Department = Sales, Salary Band = Junior) would change the story — that's exactly the kind of usage a hiring manager wants to see demonstrated.

Panel 1 — Impact of Training on Employee Performance

What this shows: A bar chart grouping employees into training-hour bins (0, 5, 10, 15, 20, 25) and plotting their average performance score in each bin: 2.00 → 2.67 → 3.36 → 4.22 → 4.62 → 5.00.

Layman meaning: The relationship is about as clean as HR data gets — performance rises almost step-for-step with training hours, more than doubling from the lowest to the highest training bin. This is a rare case where a 'more training = better performance' assumption is actually strongly backed by the data rather than just assumed.

Actionable for the user: This chart alone can justify a training budget increase to leadership — it converts a soft HR belief into a hard, visual, quantified business case.

Panel 2 — How Training Influences Performance Across Departments

What this shows: A scatter plot with a trend line, plotting average performance score against average training hours, with each point colored by department (Finance, HR, IT, Marketing, Operations, Sales).

Layman meaning: The upward trend line confirms the training-performance relationship holds even when broken out by department, not just in aggregate — it's not being driven by one outlier department skewing the company-wide number.

Actionable for the user: Departments sitting below the trend line (lower performance than their training hours would predict) are candidates for a training-quality review, not just a training-quantity increase — the dashboard makes this visually obvious at a glance.

Panel 3 — Average Job Satisfaction by Department

What this shows: A bar chart ranking all six departments by average job satisfaction: Marketing (4.75), HR (4.25), IT (4.11), Operations (3.38), Finance (3.25), Sales (3.00).

Layman meaning: There's a meaningful gap between the top and bottom of this ranking — Marketing employees report satisfaction nearly 60% higher than Sales employees on this scale. That's a large enough gap to represent a real difference in day-to-day employee experience, not just noise.

Actionable for the user: Sales should be the first stop for an HR business partner doing satisfaction follow-up interviews — the dashboard identifies exactly where to start looking, saving time versus a blanket company-wide survey review.

Panel 4 — Motivation by Salary Band and by Department

What this shows: Two donut charts: motivation share split by salary band (Mid 40%, Senior 40%, Junior 20%) and by department (IT 18%, Sales 18%, Finance 16%, HR 16%, Operations 16%, Marketing 16%).

Layman meaning: Motivation is fairly balanced across departments — no single team stands out as unusually low. But by salary band, Junior employees show only half the motivation share of Mid or Senior employees, which is a real gap given juniors are typically the largest and most cost-effective segment to retain and grow internally.

Actionable for the user: This points to a career-progression or recognition problem specifically at the junior level, rather than a department-specific issue — the fix belongs with company-wide junior-employee engagement policy, not a single team's management.

Business Takeaway

Training investment shows a clear, department-consistent payoff in performance, making it an easy case to defend to leadership. The two areas needing attention are Sales (lowest satisfaction) and Junior-band employees (lowest motivation share) — both are specific, filterable, and actionable within this same dashboard rather than requiring a separate investigation.
